

Abstract of the Disclosure

An animal collar has a band with an inner layer and an outer layer. A pair of screws extend through and protrude from the outer layer for securing to a control unit that supplies an electrical signal upon the occurrence of a selected event. A pair of conductive leads extends from the screws in opposite directions between the inner and outer layers. A threaded receptacle is located at the electrode end of each lead. An electrode extends through a hole in the inner layer and engages the threaded receptacle.
